

## Supporting Information

### New Anatase Phase $\text{VTi}_{2.6}\text{O}_{7.2}$ Ultrafine Nanocrystals for High-Performance Rechargeable Magnesium-Based Batteries

**Fig. S1** (a, b) The unit cell of anatase  $\text{TiO}_2$  before and after  $\text{Li}^+$  intercalation. (c, d) The unit cell of anatase  $\text{V}_{0.25}\text{Ti}_{0.75}\text{O}_2$  with one forth titanium atoms replaced by vanadium atoms before and after  $\text{Li}^+$  intercalation.

## DFT caculation process

The DFT was performed within the framework of Cambridge Serial Total Energy Package plane wave code.<sup>S1-S2</sup> Ultrasoft pseudopotentials were used to describe the interaction of ionic core and valence electrons. The generalized gradient approximation of Perdew–Burke–Ernzerhof method parameterized by Perdew was used to calculate the exchange and correlation terms.<sup>S3-S4</sup> Brillouin-zone integrations were performed using Monkhorst and Pack k-point meshes.<sup>S5</sup> To calculate the intercalation energy in  $V_{0.25}Ti_{0.75}O_2$ , of, the central Ti atom in the cellular is replaced with V atom. The  $Li^+$  intercalation energy ( $E_i$ ) is defined as  $E_i = E_{Li+V} - E_{Li} - E_V$ , where  $E_{Li+V}$  and  $E_V$  are total energies of intercalated  $Li^+$  and pristine VTO unit cell respectively, while  $E_{Li}$  is the energy of isolated lithium.<sup>S6</sup>
